## Hound voice search personal assistant

Virtual assistants such as Siri and the Google Assistant have made many users' lives easier and more convenient, but while both are undeniably exceptional, it is still a good idea to have an alternative. HOUND is an alternative virtual assistant offered by SoundHound. It works like Siri and the Google Assistant except that HOUND is enabled with the phrase, Ok, HOUND. Response times are fast and users can use HOUND to perform a number of tasks. HOUND can do research, set alarms, and even play music. It can also estimate weather, make calculations, and book transportation. With HOUND, completing tasks doesn't even require lifting a finger. Quick responseCan set alarms and eventsCan play from YouTubeWorks from the home screenVoice unnaturalCannot answer complex questionsHas no personality setCan be hogHOUND Voice Search & data Assistant for iPhone \*\*Currently only invites \*\* Only available in the US at this time. Need a code? Request in the app or in Speak. Get that. Hound is the app you talk to, and understand what you're looking for or trying to do. It's like a voice-enabled search engine. It's also like a personal assistant. Being the fastest and easiest way to get the information, entertainment and communication services you want, Hound is built for a handshake-free world, from the ground up. You'll find yourself opening the Hound to do what you use to type and tap, because now you can just Hound and get it faster. Popular Features:• Weather• Navigation• Local Search • Hotel Search + Expedia Booking • Make a phone call • Web search - talk what you're looking for instead of typing • Video search• News search • Photo search• Stock Search• Flight status• Date and Time• Alarm and Timer• Music search• SoundHound Now - enable music recognition search or Sing/Hum search• Mortgage Calculator • Mortgage Calculator• Words and phrases and moreYou can go hands free by saying, Ok HoundWhat makes Hound amazing? The Speech-to-Meaning Hound engine delivers unparalleled speed and accuracy. Speech recognition and understanding of natural languages are done simultaneously and in real time. Compared to the traditional approach of doing speech recognition first, then sending the results to search engines or understanding, Hound does it right away. You experience speed and accuracy. You can speak naturally. No need to speak in fragmented keywords. Hound has the ability to handle natural language sentences, including details, specifics, and some criteria (think, for example, describing the hotel you want to find to have a gym, free wi-fi and less than \$200 per night). Hound can understand exceptions and negations (for example, if you want to find a place for lunch, but since you already have Chinese all week, you can say show me restaurants nearby, excluding Chinese places). It empowers you to really get what you're looking for, faster, and with a great experience. End User NewsWeatherLocal SearchRidesScoresFlight StatusStocksTravel THEO DÕI CHUNG TÕI All the best free apps you want on your SHAREit Android - Connect & Transfer Send your files quickly and easily Transfer files and share applications An indispensable application to keep your application updated Alternative market for Android Two accounts, one application using one smartphone Hacks for this online fighting game Get a leg up on your favorite video games Do we really need another personal assistant for our phones? Siri and Google Now are already baked into apple and Android phones respectively, but Hound thinks it can do better. Hound is SoundHound's digital assistant app, first released as a beta in 2015. Now, the app is ready for everyone to enjoy and comes with some tricks that one-up both Google Now and Siri. It's available for free starting today on the App Store and Google Play.Specifically, Hound is built to handle multiple demands at once, so you can ask complicated questions, like What day of the week will June 14 be in 2030? and it will understand all the pieces of the question to give you the correct answer. SoundHound CEO Keyvan Mohajer said that Hound uses speech to recognition technology, compared to speech to text and then text to recognition used by its competitors. All that means to you are faster search results and better answers to long questions. What can a Hound do that no one else can? Currently the only personal assistant currently able to hail an Uber ride and tell you the cost, distance and time of the ride. If you schedule a conference call or appointment in another part of the world, Hound can tell you the time in your current location and other time zones. Sniffer dogs can exclude certain results from restaurant searches. For example, you can ask for a nearby Asian restaurant that is not Thai or Japanese all in one sentence. You can improve your results further by asking to show only restaurants that are open now, have parking and are cheap. With hotels, you can shake up your needs list of San Francisco hotels from May 25 to May 31 that are pet-friendly and under \$500 per night and Hound pieces together all those attributes into your search. See examples below, with Hound on the far left, Siri in the middle and Google Now on the right. Screenshot by Sarah Mitroff/CNET After toying with the beta for the past year, and testing the final version for a few days, I was impressed with how quickly she found what I was asking for. But is it really a personal assistant to rival everyone else? Not exactly. I put the Hound, Google Now Siri to test in different categories to see which one fared best. This is how they do it. Again, Hound is on the left, Siri in the middle and Google Now on the

right. For the sake of simplicity, I didn't test Cortana.Sports Screenshot by Sarah Mitroff/CNET For a recent sports score, all three got it right, but the difference came down to the presentation. Hound gives some while Siri provides more details (based on a quarter) of the score. Directions and transport Screenshots by Sarah Mitroff/CNET Are all the same, although Siri redirects to the default Apple Maps app, while Google and Hound display some information before you navigate. Unfortunately, Hound couldn't give me public transport directions when I asked, but Google Now and Siri could. Screenshots of general knowledge by Sarah Mitroff/CNET Hound are unfair here, offering only search results for almost every question I question. Hounds do have a bond with Wikipedia, but you'll need to use the right search terms - such as Tell me about piggy banks or Mount Everest Wikipedia - to get those results. Siri usually only gives me paragraphs from Wikipedia that I have to read myself, while Google Now actually speaks the answer. Looking for celebrity Screenshots by Sarah Mitroff/CNET All three are fine when looking for celebrities whether widely known or not, as well as historical figures, athletes and fictional characters. Siri and Google Now provide the latest details, although Google wins to find the photos (serious Siri, put them together). Movies and TV Screenshots by Sarah Mitroff/CNET When searching for actors in TV shows and movies Hound failed, showing results for the 1961 Avengers TV show, instead of a recent film. I can get the right answer if I ask about Avengers: Age of Ultron, but this app doesn't recognize the original 2012 movie. And yes, I also asked who plays Natasha Romanoff in The Avengers? to no avail. Weather screenshots by Sarah Mitroff/CNET All three perform well, recounting conditions and high temperatures. While only Hound and Google Now really highlight the right day of the week, Siri and Hound earn points for personality. Screenshots of Personality by Sarah Mitroff/CNET Speaking of personality, Mohajer Hound told me that Hounds are not made to be intelligent or funny, not just functional. Nonetheless, Hound and Siri have more personalities than Google, which doesn't want to answer questions about Siri or is willing to tell jokes. Who's the best listener? In my tests, Hound and Google Now were the best at understanding the words I said without misinterpreting me. Siri is often wrong, although it will let you edit what you say. All three give you just a few seconds to complete your request before starting to search. If you stop too long, it will search based on whatever sounds you say first. Who's the best overall? No single application is an end-all, be-all personal assistant. Google Now is fantastic in pulling facts and searching the web; Siri is great for setting reminders, friends, and control your phone; and Hound is best for handling complicated requests, such as finding hotels. Everything is good for different purposes, but we haven't found an app that combines all its strengths. Even Cortana, which is quite well rounded, can't understand the demand for longer. And for things depending on your operating system, you, it may be stuck with one option – only Siri can access the apps on your iPhone and only Google Now on your Android. But for others, we enter the realm of mixing and matching digital assistants depending on who is up to which task. That's where Hound has been more useful than I expected: I'll use it to find places to eat and to hunt for my next hotel - even if Siri will remain my destination for morning weather reports and Google Now is still my mainstay for interesting facts. There is not one digital assistant to rule them all. But since this team of three assistants works for free, I can't complain too much. Many.
